

PRECISION

ageLOC® YOUTH

STEP 1

Raw Ingredient

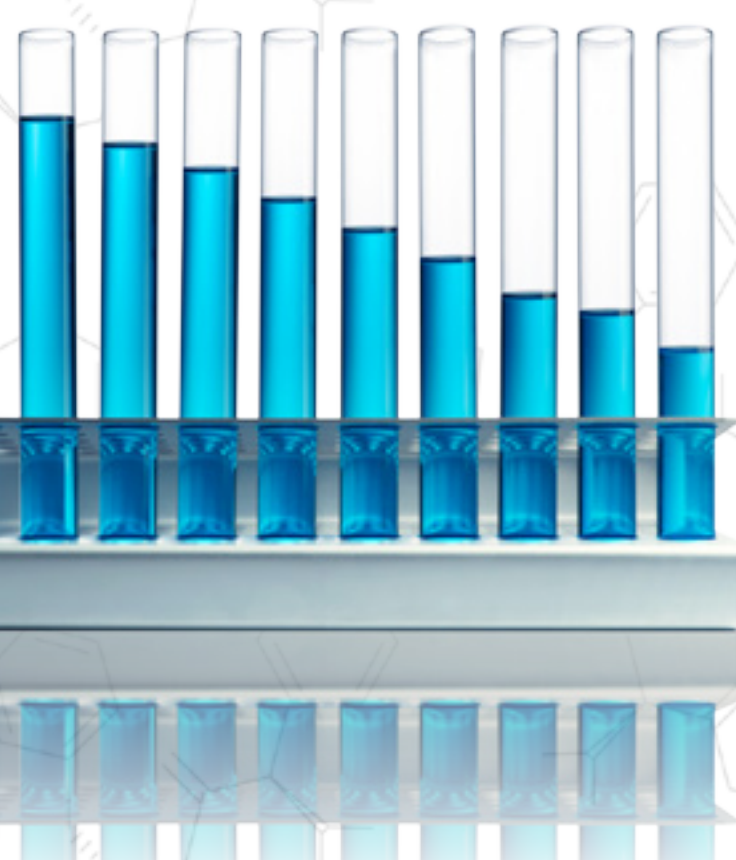

We used scientific literature and in-house expertise to select raw ingredients that provide specific anti-aging benefits for ageLOC Youth. For example, we used the beneficial fatty acids EPA and DHA from fish oil.

STEP 2

Extract

When appropriate, we used extracts of the raw ingredients. Extracts concentrate the specific active compounds that produce the intended benefit. For example, we used extracts of bioflavonoids from citrus peel.

STEP 3

Standardize

We identified sources of each ingredient that are standardized to the active ingredients or compounds. For example, with rosemary, our source delivers a specific amount of carnosic acid in each batch to produce the results you expect every time you take ageLOC Youth.

STEP 4

Screening

We used our proprietary ageLOC filter to screen ingredients to help us understand exactly which ingredients had the desired effects on aging symptoms.

STEP 5

Blend

We combined multiple ingredients in precise levels for a consistent blend. The blend included fatty acids, bioflavonoids, carnosic acid, quercetin, d-Limonene, lutein, and other active ingredients. We tested this blend to ensure the formula produced the benefits we observed in our initial screening.

STEP 6

Finished Product

Finally, we carried out safety testing on the completed formula and continue to study the final blend in human clinical trials. This formula then became the finished product.
